

Early Journal Content on JSTOR, Free to Anyone in the World

This article is one of nearly 500,000 scholarly works digitized and made freely available to everyone in the world by JSTOR.

Known as the Early Journal Content, this set of works include research articles, news, letters, and other writings published in more than 200 of the oldest leading academic journals. The works date from the mid-seventeenth to the early twentieth centuries.

We encourage people to read and share the Early Journal Content openly and to tell others that this resource exists. People may post this content online or redistribute in any way for non-commercial purposes.

JSTOR is a digital library of academic journals, books, and primary source objects. JSTOR helps people discover, use, and build upon a wide range of content through a powerful research and teaching platform, and preserves this content for future generations. JSTOR is part of ITHAKA, a not-for-profit organization that also includes Ithaka S+R and Portico. For more information about JSTOR, please contact support@jstor.org.

The third Remark is, the Reason that invites *Thrushes* or *Starlings* under the Legs of black Cattle grazing in a Pasture. Not being able to get near them, I observed them at a Distance with a good Glass. I saw all these Birds thrust their Head and half their Body down into the Grass, in such manner that their Tails remained erect in the Air, as that of a *Duck* upon diving; which makes me think, that those Birds seek after Worms in the Earth; and that they gather about the Cattle, because as they are large Animals, upon trampling on the Ground, they oblige such Worms to come forth, as happen to be press'd under the Weight of their Hoofs.—I shall be glad of every Opportunity of convincing you how much I respect you, and am,

*Your most humble,
and most obedient Servant,*

Pluche.

XIX. *A Letter from John Bartram, M. D. to Peter Collinson, F. R. S. concerning a Cluster of small Teeth observed by him at the Root of each Fang or great Tooth in the Head of a Rattle-Snake, upon dissecting it.*

Mr. Collinson, *Philadelphia, July 17. 1734.*
NEAR *German-town*, about six Miles from this City, we found a *Rattle-snake*, which is now become a Rarity so near our Settlements. I took it home,

home, and dissected it: In the Head I met with what has not been observed before by any, that I can remember — that is, a Cluster of Teeth on each Side the upper Jaw, at the Root of the great Fangs, through which the Poison is ejected. — I observed, in the same Case, that the two main Teeth were sheathed in, lay four others at the Root of each Tooth, in a Cluster together, of the same Shape and Figure with the great ones — and I am apt to think for the same Use and Purposes, if by Accident the main Teeth happen to be broken — as was the Fellow to this that I send you. — May not these Cluster of Teeth be placed to supply such a Defect successively — for the Support and Defence of this Creature?

I am not certain whether this is an uncommon Case; perhaps others have not dissected the Head of this Animal with the Care that I have done. —

I am yours,

John Bartram.

XX. *Notices of some Meteors observed at Philadelphia in North-America by Joseph Breintnall, extracted out of a Letter from him to Peter Collinson, F. R. S.*

Philadelphia, May 9. 1738.

— THE remarkable *Aurora Borealis*, that was seen in *Europe* the Beginning of last *December*, was not seen here.

But
